

**PROPOSAL FOR EXPERIMENT AT RCNP**

TITLE: Response of stacked GSO detector to light charged particles  
– Measurements of (p,dx) cross sections for nuclear data –

SPOKESPERSON: Yusuke Uozumi  
Department of Nuclear Engineering, Kyushu University  
Associate Professor  
Hakozaki 6-10-1, Higashi-ku, Fukuoka 812-8581 Japan  
Tel: 092-642-3767 Fax: 092-642-3800  
Email: uozumi@nucl.kyushu-u.ac.jp

EXPERIMENTAL GROUP:

Department of Nuclear Engineering, Kyushu University  
Yusuke UOZUMI (AP), Genichiro WAKABAYASHI (RA)  
Nobuo IKEDA (AP), Masaru MATOBA (P)  
Shozo AOKI (D4), Shafarudyn (D2)  
Cao BIN (D1), Fuminobu SAIHO (M2)  
Shinya HOHARA (M1), Masahiro KIN (M1)

University of Tokushima, Faculty of Integrated Arts and Sciences  
Norihiko Koori (P)

University of Occupational and Environmental Health  
Masahiro Nakano (AP)

RUNNING TIME: Installation time without beam 10 days  
Test running time for experiment 1 day  
Data Runs 1.5 days  
Total beam time 2.5 days

BEAM LINE: ES course

BEAM REQUIREMENT:  $^4\text{He}$  400 MeV 1 nA on target

BUDGET: Travel expenses 1,000,000 YEN

TITLE: Response of stacked GSO detector to light charged particles  
– Measurements of  $(p, dx)$  cross sections for nuclear data –

SPOKESPERSON: Yusuke UOZUMI

Department of Nuclear Engineering, Kyushu university  
6-10-1, Hakozaki, Higashi-ku, Fukuoka 812-8581, Japan

### SUMMARY OF THE PROPOSAL

We propose an experiment to measure the response of stacked GSO scintillator detectors to intermediate-energy deuterons. The detectors have been developed to measure charged particle production cross-sections, that is, the nuclear data for applications. In our previous works, proton-production cross-sections were measured with  $(p, p'x)$  reactions at 300 and 392 MeV by using the detectors. In these experiments, deuterons were also detected. Provisional energy and angular distributions of the  $(p, dx)$  data can not be reproduced by the quantum molecular dynamics model. It is very important to fix the cross sections. In order to obtain energy distributions of deuterons, we have to determine the light output and the peak efficiency of GSO scintillator detectors to intermediate-energy deuterons.

In the experiment, alpha particles will be accelerated and bombard a CD2 target. Pulse height distributions will be measured for mono-energetic deuterons and alphas from elastic  $d + \alpha$  scattering. It will allow us to determine the energy spectra of deuterons accurately.
