

## PROPOSAL FOR EXPERIMENT AT RCNP

12 July 2007

**TITLE:**

Measurement of neutron energy spectra at 180 degrees in proton induced reaction at 150, 250 and 350 MeV

**SPOKESPERSON:**

Full Name Yosuke IWAMOTO  
 Institution Nuclear Science and Engineering Directorate, Japan Atomic Energy Agency  
 Title or Position Researcher  
 Address Tokai-mura, Naka-gun, Ibaraki 319-1195, Japan  
 Phone number +81-29-282-6704  
 FAX number +81-29-284-3741  
 E-mail iwamoto.yosuke@jaea.go.jp

**EXPERIMENTAL GROUP:**

Full Name	Institution	Title or Position
Yosuke IWAMOTO	Japan Atomic Energy Agency	(Researcher)
Daiki SATOH	Japan Atomic Energy Agency	(Researcher)
Yukio SAKAMOTO	Japan Atomic Energy Agency	(Senior Researcher)
Tatsuhiko SATO	Japan Atomic Energy Agency	(Researcher)
Akira ENDO	Japan Atomic Energy Agency	(Senior Researcher)
Masayuki HAGIWARA	High Energy Accelerator Research Organization	(Assistant Professor)
Hiroshi IWASE	High Energy Accelerator Research Organization	(Assistant Professor)
Yoichi KIRIHARA	Sokendai	(Graduate Student)
Hiroshi YASHIMA	Research Reactor Institute, Kyoto Univ.	(Assistant Professor)
Takashi NAKAMURA	Cyclotron and Radioisotope Center, Tohoku Univ.	(Professor Emeritus)
Atsushi TAMII	Research Center for Nuclear Physics, Osaka Univ.	(Associate Professor)
Kichiji HATANAKA	Research Center for Nuclear Physics, Osaka Univ.	(Professor)

**RUNNING TIME:** Installation time without beam 1 day(for each beam time)  
 Test running time for experiment 0.5 days  
 Data runs 4.5days (for 150, 250 and 350MeV proton)

**BEAM LINE:** Ring : N0 course

**BEAM REQUIREMENTS:** Type of particle p  
 Beam energy 150, 250, 350 MeV  
 Beam intensity  $\leq 100$  nA  
 Any other requirements halo-free, small emittance, beam pulsing

**BUDGET:** Traveling expenses 500,000 yen

**TITLE:**

**Measurement of neutron energy spectra at 180 degrees in proton induced reaction at 150, 250 and 350 MeV**

**SPOKESPERSON:** Yosuke Iwamoto

**SUMMARY OF THE PROPOSAL**

Recently, the contribution of 180 degrees scattering neutrons, which come from mainly evaporation process, is getting more important because of radiation protection and shielding at some very high-intensity proton accelerator facilities. Neutron production double differential cross sections at 180 degrees have not been measured and studied yet. Therefore, it is interesting to find the systematic behavior of the evaporation neutron spectra, and to parameterize them for extending to different incident energies and target nuclei.

The moving source (MS) model which is based on the Maxwell-like distribution will be employed for analyzing the obtained data. The systematic values of amplitude, velocity and temperature in MS model will be decided by using obtained data in the wide target mass and incident energy ranges. The systematic of these parameters is very useful for the estimation of evaporation neutron cross section in a wide range of target masses and incident energies.

It is possible to measure neutrons at 180 degrees at the irradiation room of TOF course. and no other facilities can be available. In this study, we will measure the energy-angle differential neutron yields for the (p,xn) reaction of 150-350 MeV at 180 degrees on thin graphite, aluminum, iron and lead targets, and the parameterization of the evaporation cross sections will be made by MS model. To investigate consistency with other experimental data, measurement at 90 and 150 degrees will be also done.

An estimation of the background contribution due to room scattering will be performed by intercepting the neutrons produced at the target with a iron shadow bar. Installation time without beam is 1 (day) for each beam time, test running time to investigate background events is 0.5 (days) and data running time is estimated as 4.5 (days).
