Explosive Nucleosynthesis in Core Collapse Supernovae

Marco Limongi

INAF - Osservatorio Astronomico di Roma

Explosive nucleosynthesis occurring during the explosion of a core collapse supernova is responsible for the synthesis of many heavy elements which are not produced during the hydrostatic nuclear burnings stages. In this talk I will review the basic properties of this phenomenon, with special attention to the origin of the various elements (isotopes) as well as the most efficient nuclear reactions responsible for their production.
