

The Highest Energy Cosmic Rays

M.Teshima¹ and AGASA collaboration

^a *Institute for Cosmic Ray Research, University of Tokyo*

The recent topics on the highest energy cosmic rays will be discussed. The cosmic rays above the theoretical cut off energy were found by AGASA, Fly's Eye and HiRes experiments. Present experimental status and its theoretical indications will be presented. Recently, AGASA obtained the firm result on the cluster of events in their arrival directions. This may be the strong evidence for point sources of the highest energy cosmic rays. This is a great advance on resolving the origin of the highest energy cosmic rays. The review of future projects will be also presented.
