# Outline

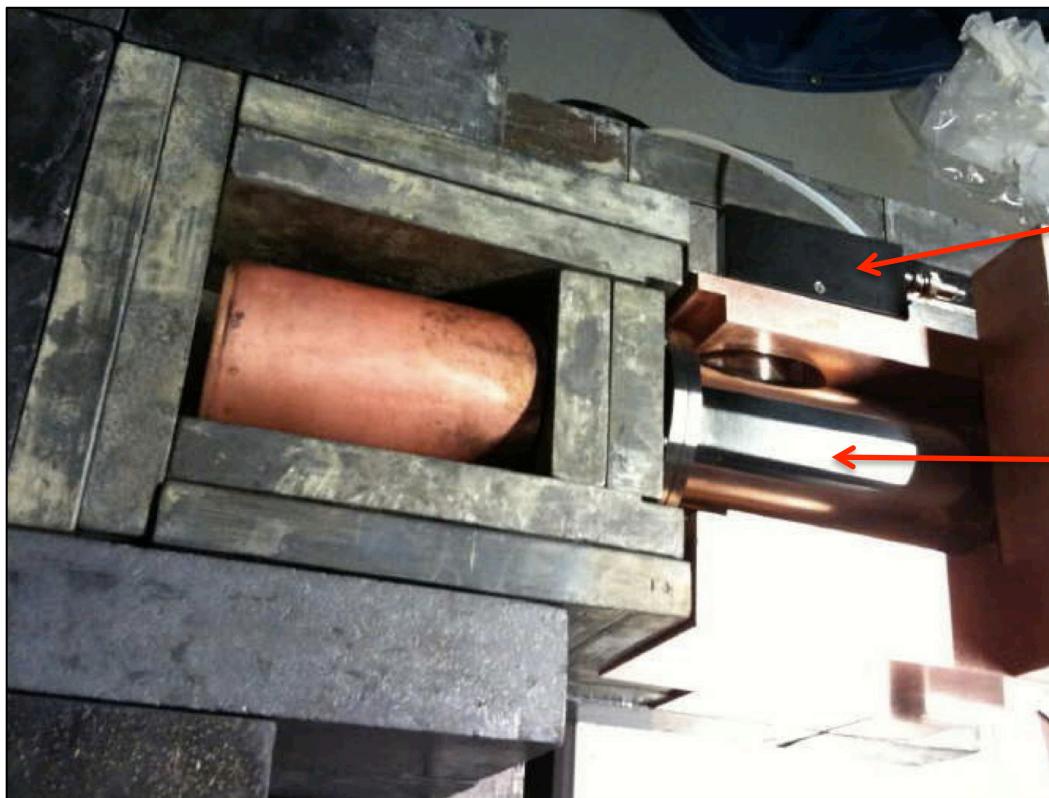

- ▶ Impetus → CoGeNT/Dark Matter
- ▶ Background considerations → Front-end sets background
- ▶ Initial cryostat design
- ▶ Fabrication
- ▶ Thermal testing
- ▶ Thermal model
- ▶ Detector integration
- ▶ Preliminary detector performance
- ▶ Thoughts on improvements
- ▶ Thoughts on low background counter design

# Impetus for a new cryostat design (circa summer 2012)

- Desire to test CoGeNT dark matter results with new detectors having:

|                          |                                 |
|--------------------------|---------------------------------|
| ■ Lower background       | ~5-10× (to ~1 count/keV/kg/day) |
| ■ Lower energy threshold | ~2-5× (to ~100 eV)              |
| ■ Larger mass            | ~3× (to 1.25 kg)                |

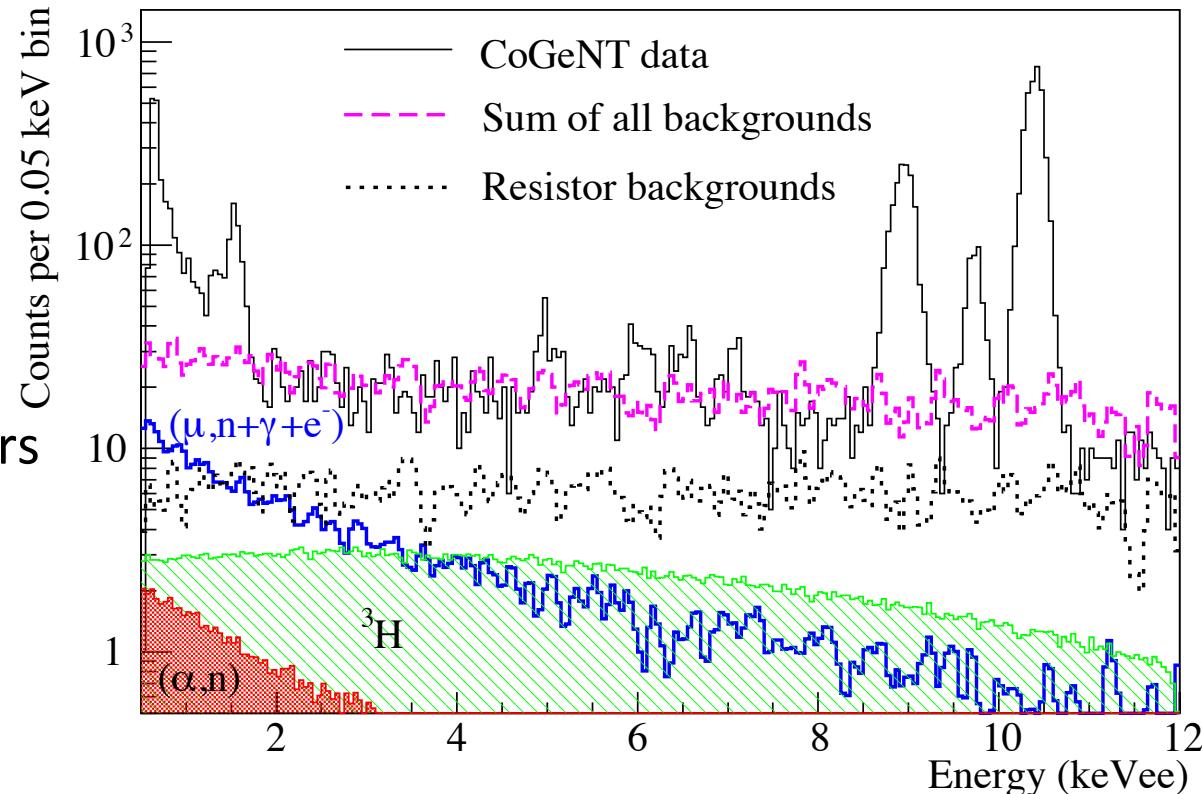

Preamp  
Al dipstick

# Background considerations for new cryostat

- ▶ CoGeNT background dominated by front-end read-out
  - Contains multiple resistors
    - 1 for read-out
    - 1 for heating the FET

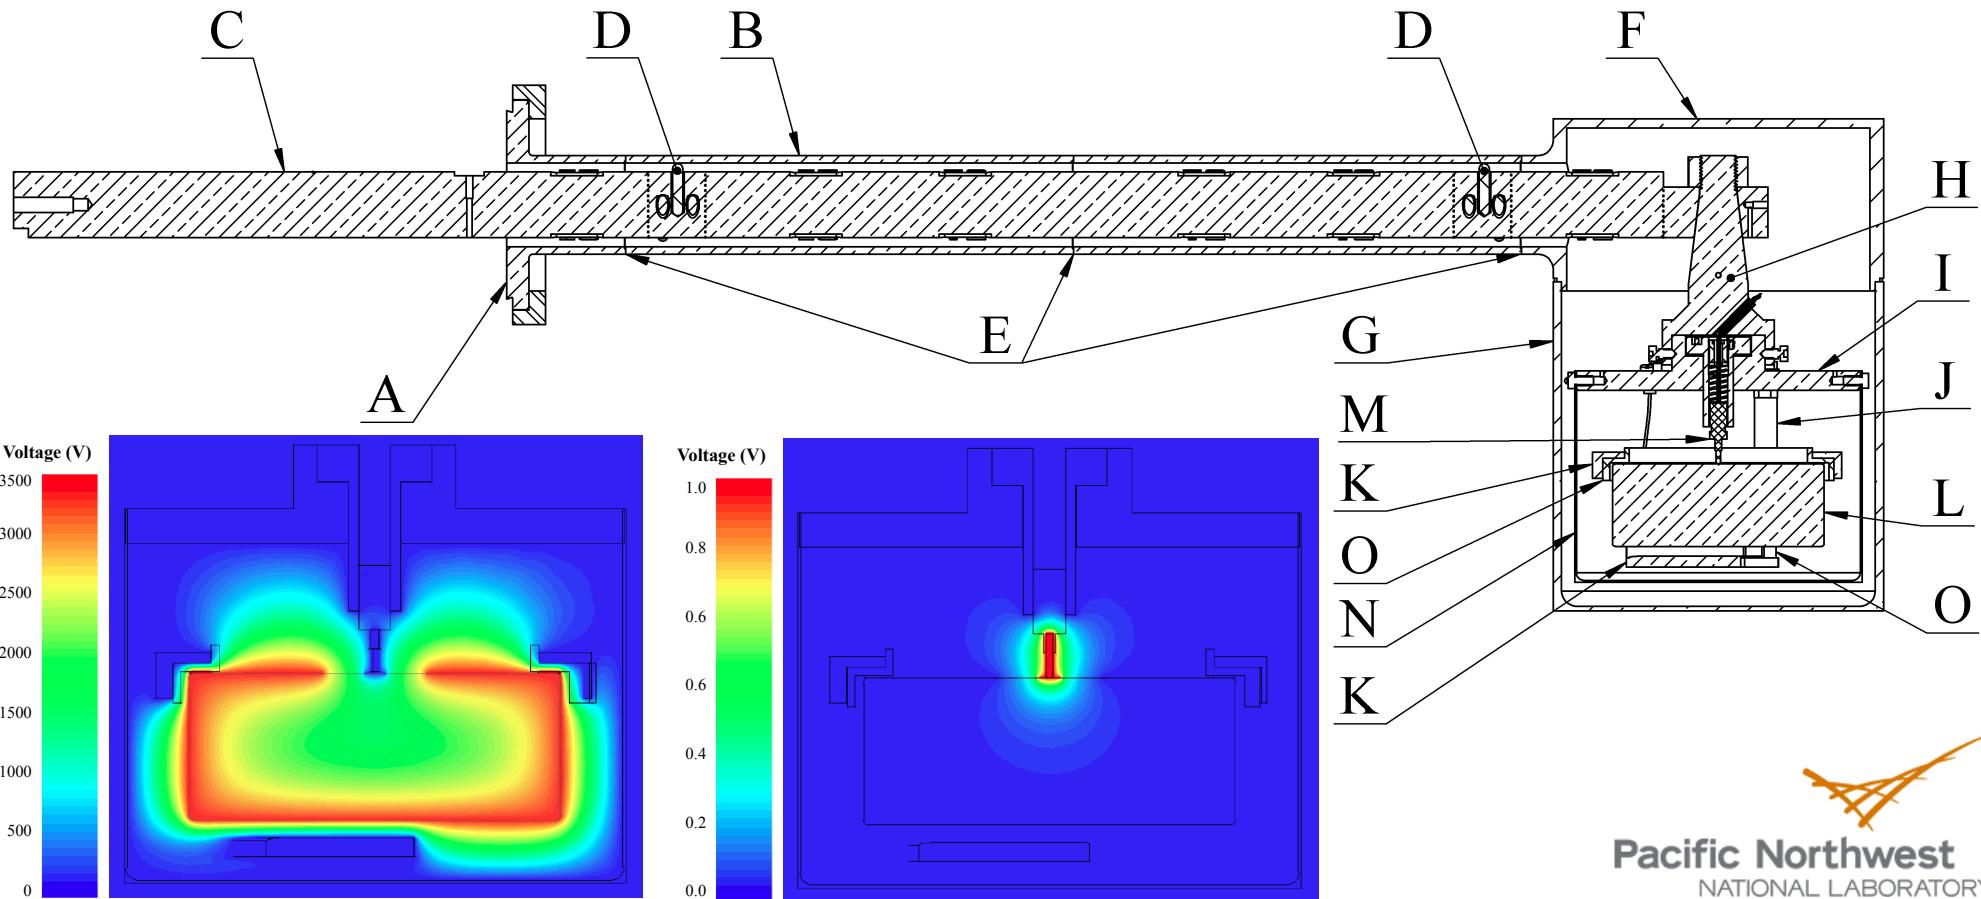

- ▶ New design anticipated using same front-end (for low-energy threshold) but without heater resistor
- ▶ Implications:
  - Front-end will still dominate background
  - Use a mixture of OFHC and electroformed copper “as convenient”
  - Otherwise, employ all low-background best practices.

# Initial cryostat design and thermal model

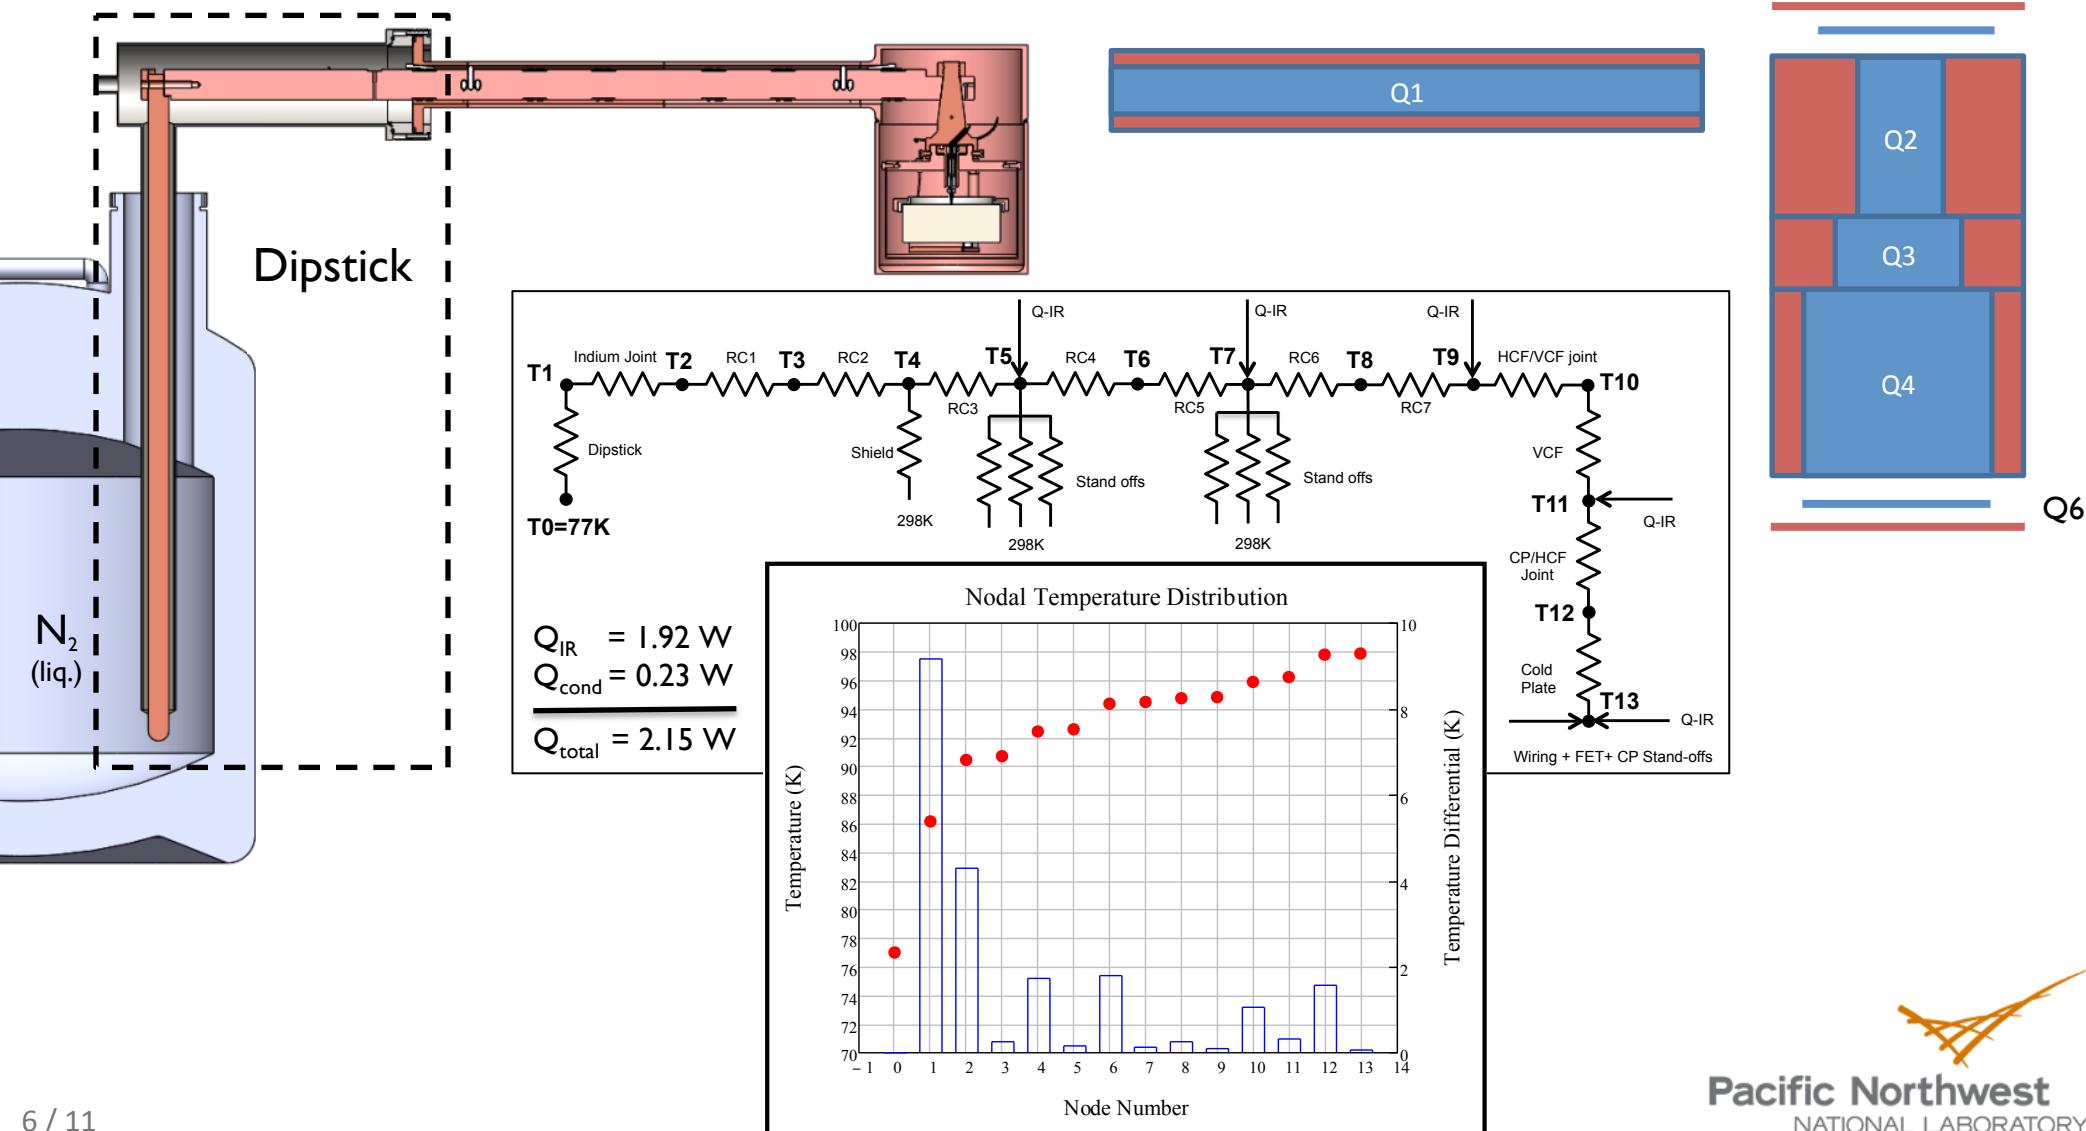

## ► Areas of design focus:

- Field modeling for low capacitance
- Thermal modeling for low crystal temperature
- “Low-background” (see previous slide)

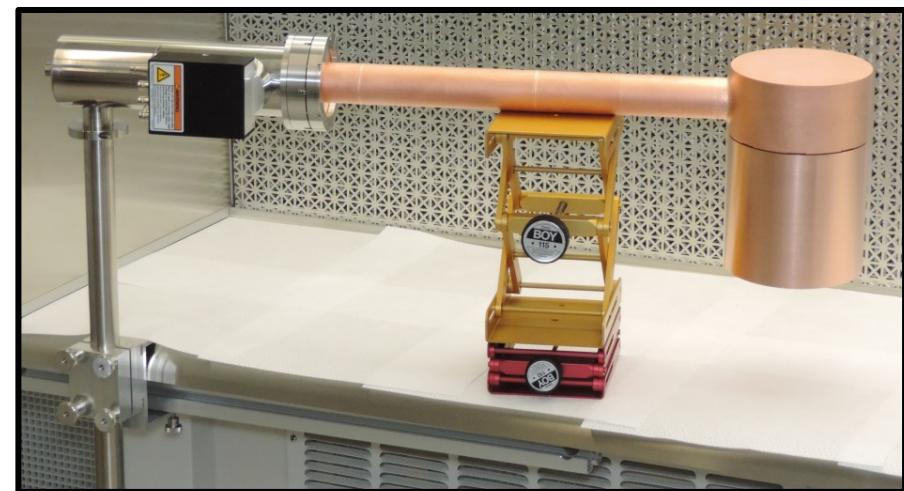

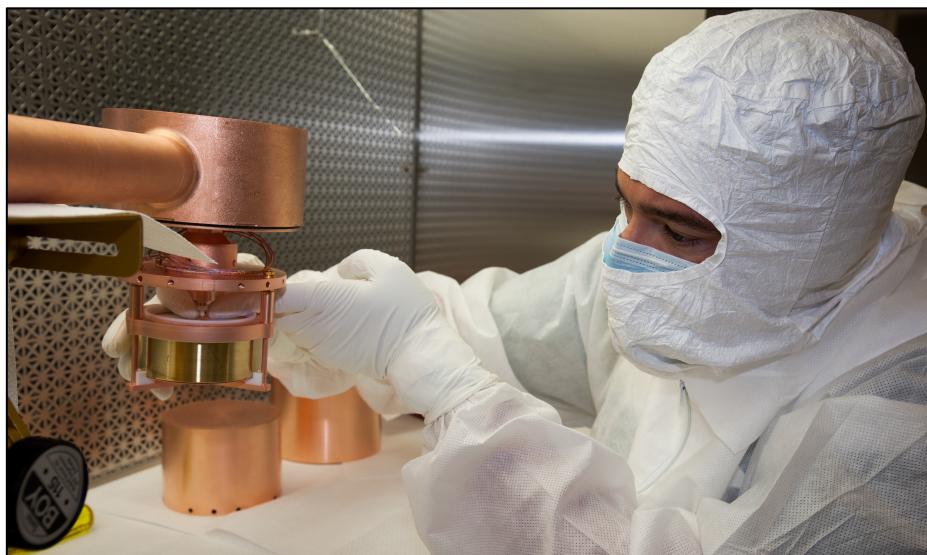

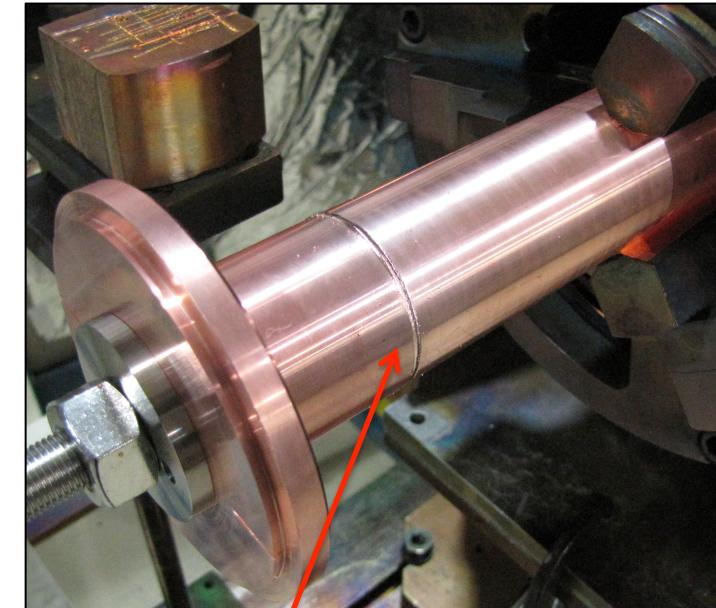

# Initial cryostat thermal model

## ► Simplified “by hand” calculation

# Fabrication

- ▶ Electroformed copper:
  - End cap and crystal IR shield
- ▶ OFHC copper everywhere else
- ▶ E-beam welds to make cross-arm vacuum jacket
- ▶ All copper etched and passivated
- ▶ Limited use of PTFE as crystal mount/HV stand-off

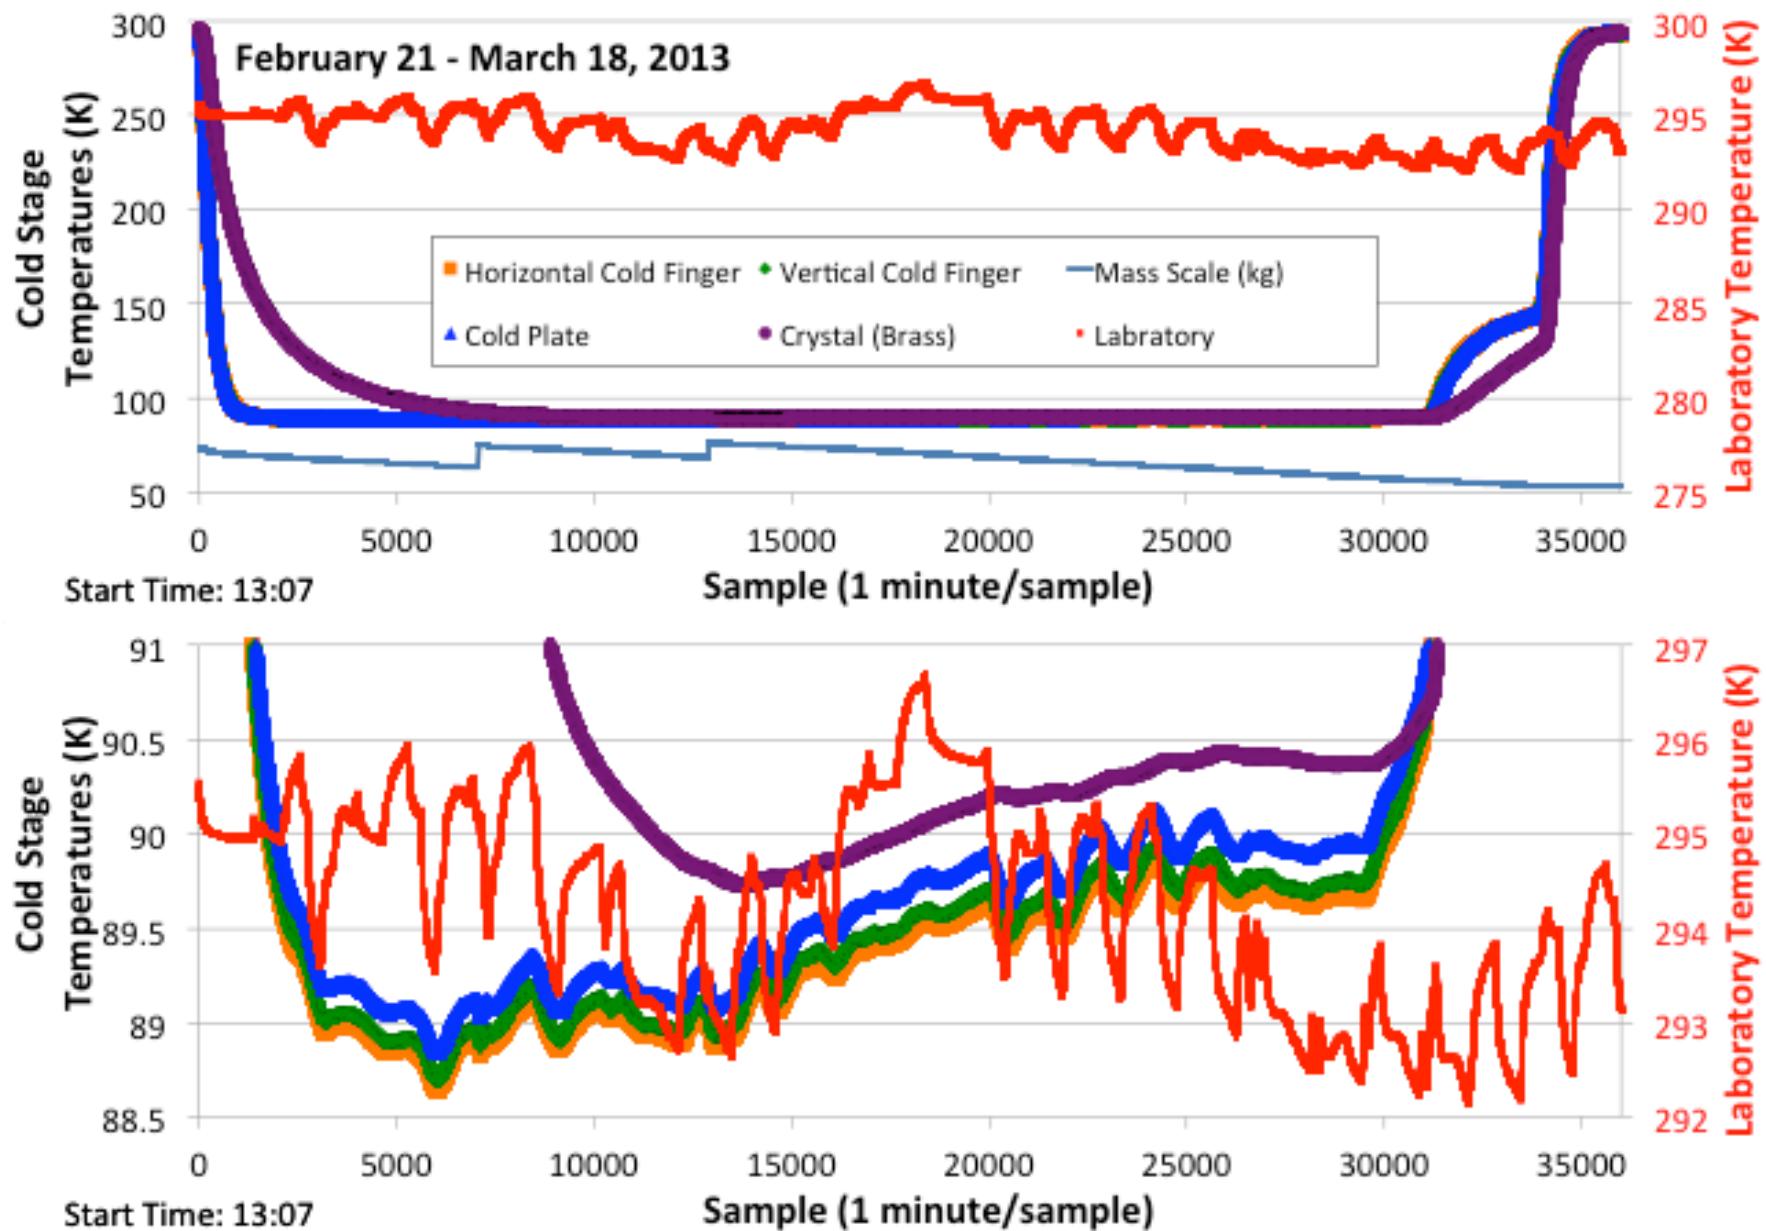

# Thermal testing

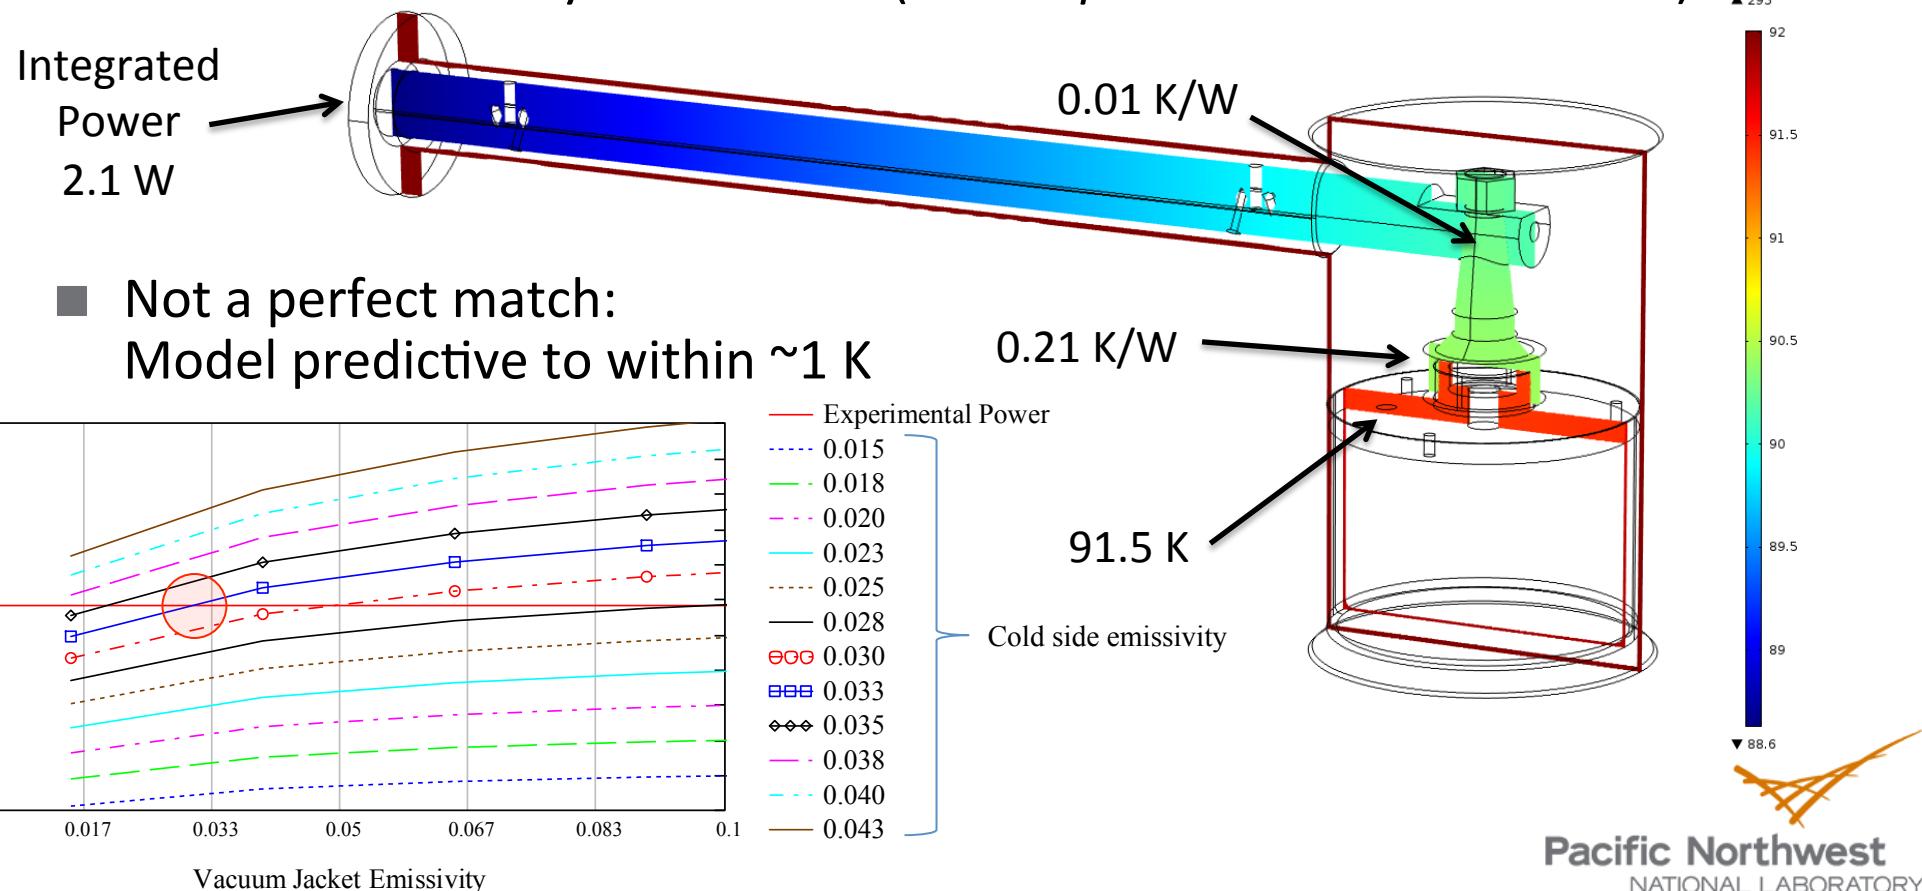

Pacific Northwest  
NATIONAL LABORATORY

# Thermal testing

# Thermal model (COMSOL)

- ▶ Largest uncertainty in initial thermal model: Joint resistance
- ▶ COMSOL model developed to extract joint resistances from measured temperatures (previous page)
  - Tweaked emissivity for ‘best’ fit ( $3.2\%$  – prior measurements  $\sim 3\%$ )

# Detector integration at CANBERRA (Meriden, CT)

- ▶ HPGe crystal (SAGE design – See CANBERRA poster)
  - 1.268 kg, 92 mm diameter, 36.5 mm height
- ▶ Pulser peak FWHM in CANBERRA cryostat = 87 eV

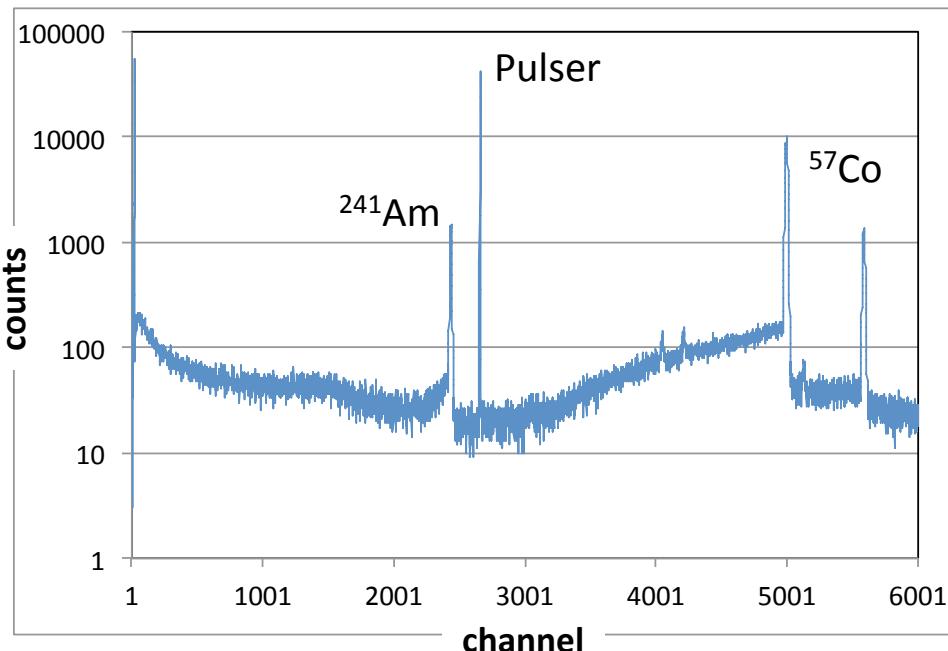

Integration performed by:  
Todd Hossbach (PNNL)  
Mike Yocum (CANBERRA)

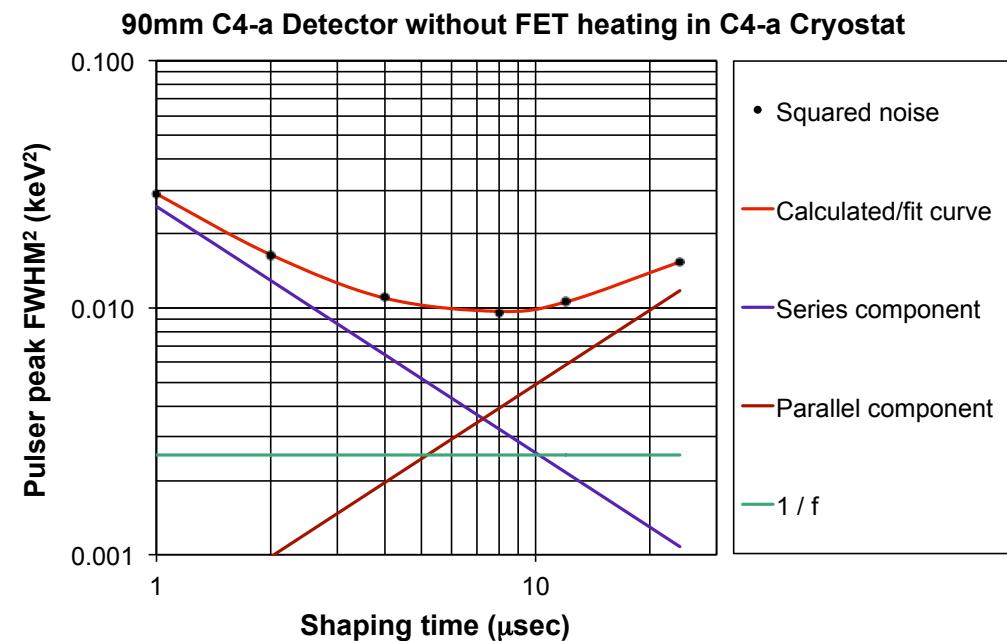

Pacific Northwest  
NATIONAL LABORATORY

# Preliminary performance

- ▶ 96 hour cool down
- ▶ Operated at expected bias (3000 V)
- ▶ 98 eV pulser peak FWHM

| Shaping time<br>during measurement   | 8 $\mu$ s<br>(Day 2) | 4 $\mu$ s<br>(Day 2) |
|--------------------------------------|----------------------|----------------------|
| Pulser FWHM                          | 98 eV                | 105 eV               |
| FWHM @ 59 keV ( $^{241}\text{Am}$ )  | 342 eV               | 336 eV               |
| FWTM @ 59 keV ( $^{241}\text{Am}$ )  | 628 eV               | 625 eV               |
| FWHM @ 122 keV ( $^{57}\text{Co}$ )  | 477 eV               | 481 eV               |
| FWTM @ 122 keV ( $^{57}\text{Co}$ )  | 873 eV               | 876 eV               |
| FWHM @ 1332 keV ( $^{60}\text{Co}$ ) | 1905 eV              | 2107 eV              |
| FWTM @ 1332 keV ( $^{60}\text{Co}$ ) | 3525 eV              | 3912 eV              |

- ▶ Further characterization underway at University of Chicago!

# Thoughts on design improvements

- ▶ Larger diameter vertical dipstick
  - Improved cooling
- ▶ Additional instrumentation ports on dipstick portion
  - Additional feed-throughs across from preamp for thermal testing
- ▶ Super-insulation around the horizontal cold finger
  - Reduce the IR heat load
- ▶ Remove: vertical cold finger *to* cold plate joint
  - Feature wasn't used
- ▶ More attention to crystal-end wiring routing
  - Wiring worked, it was just very tedious to work with
- ▶ *Plan a design for 2+ kg p-type point contact HPGe crystal!*

# Thoughts on low-background counter design

- ▶ Design intended for dark matter research...
- ▶ However, result appears like a good low-background counting system design
- ▶ Some changes needed:
  - Design as an “Up-looker”
    - This is not difficult
  - Reduce thicknesses of end-cap and crystal IR shield
    - Tunable with electroforming
  - Design an appropriate low background shield
    - CoGeNT shield wasn’t difficult to design or make...  
but CoGeNT didn’t have a sample counting chamber & door

# Thank you!

**Low Radioactivity Techniques 2015**

**WORKSHOP V**

The LRT workshop examines topics in low radioactivity materials and techniques, a fundamental aspect of rare event searches, including dark matter, solar neutrinos, double-beta decay, and long half-life phenomena.

This is the fifth workshop in the LRT series focusing on all aspects of the development of low background detectors and techniques.

**March 18-20, 2015**
