# AMoRE Introduction

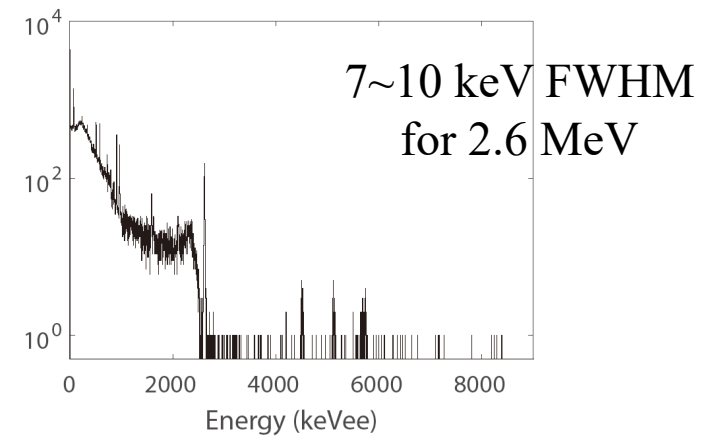

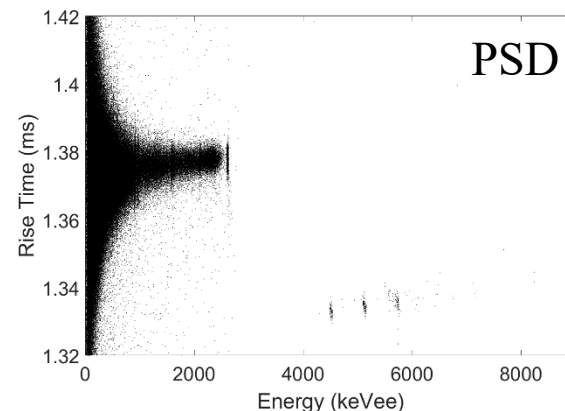

$^{100}\text{Mo}$

- ✓  $Q = 3034 \text{ keV} > ^{208}\text{Tl}$  line (2615 keV)
- ✓ Natural abundance : 9.7%
- ✓  $T_{1/2} (2\nu) = 7.1 \times 10^{18} \text{ y}$ : the largest  $\beta\beta$  decay rate

$^{40}\text{Ca}^{100}\text{MoO}_4$  : enriched  $^{100}\text{Mo}$  and depleted  $^{48}\text{Ca}$   
 : Selected for a pilot and AMoRE-1'  
 : High  $T_D = 446 \text{ K}$ , Large scintlation yield

$\text{Li}_2^{100}\text{MoO}_4$ : Selected for AMoRE-II  
 : Moderate:  $T_D = 316 \text{ K}$   
 : Hygroscopic, Low scintlation yield

MMC for heat and light detection

# Low Temperature Thermal Calorimeters

“Thermal calorimetric measurement of heat signals at mK temperatures”

Energy absorption → Temperature

Choice of thermometers for  $0\nu\beta\beta$  searches

- **Thermistors (NTD Ge)** CUORE, CUPID
- **MMC (Metallic Magnetic Calorimeter)** AMoRE CANDLES-LT
- **TES (Transition Edge Sensor)** Light detector, mutli-phonons
- **KID (Kinetic Inductance Device)** CALDER
- etc.

# Simultaneous phonon-scintillation detection for $0\nu\beta\beta$ searches

- ✓ Scintillating crystal as target material

Scintillating crystal →  
 Active bkg. Rejection  
 using **L/H ratio and PSD**

# Magnetic microcalorimeter (MMC)

(Metallic Magnetic Calorimeter)

- Paramagnetic alloy in a magnetic field  
Au:Er(300-1000 ppm), Ag:Er(300-1000 ppm)  
→ Magnetization variation with temperature
- Readout: SQUID
- High resolution + High linearity + Wide dynamic range + Absorber friendly + No bias heating + Relatively fast + MUX
- More wires & materials needed for SQUIDs and MMCs

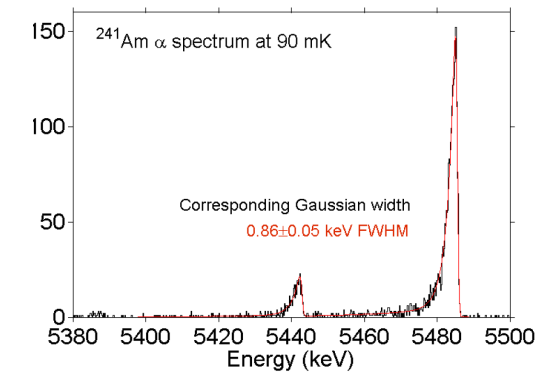

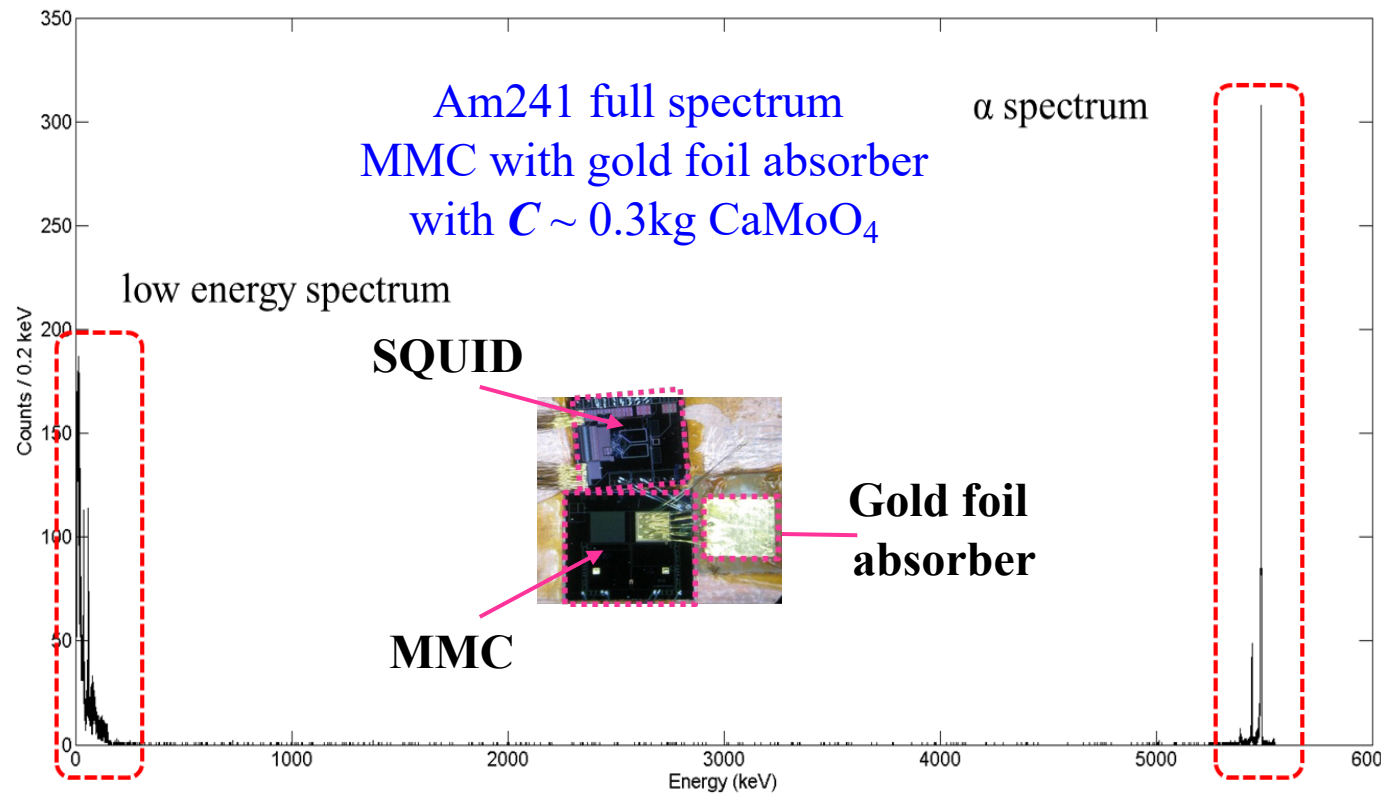

# MMC performance in a wide energy region

“Superior dynamic range with high resolution”

**0.3 keV FWHM  
for 60keV  $\gamma$**

$$\frac{\delta E_{rms}}{E} = 1/15,000$$

**0.9 keV FWHM Gaussian width  
for 5.5MeV  $\alpha$**

# AMoRE Detector Progress

13 CMOs  
+ 5 LMOs

**Ended 2023**

AMoRE-I

**To begin 2024**

AMoRE-II  
Being prepared

# AMoRE Pilot result

- $^{48\text{depl}}\text{Ca}^{100}\text{MoO}_4$ : 6 crystals 1.9 kg (0.9kg  $^{100}\text{Mo}$ )
- Proof of the AMoRE detection principle
- Understanding of the background components & their reductions
- Background level of  $\sim 0.5$  c/kg at 2.8-3.2 MeV
  - n-induced  $\gamma$ , Internal bkg, rock/air-radon  $\gamma$
  - Internal background— arXiv:2107.07704
- $T_{1/2}(0\nu) > 3.2 \times 10^{23}$  years at 90% CL.

# AMoRE Pilot → AMoRE-I

- 18 crystals: 13  $^{48\text{depl}}\text{Ca}^{100}\text{MoO}_4$  (4.58 kg) + 5  $\text{Li}_2^{100}\text{MoO}_4$  (1.61 kg)
- Total crystal mass 6.19 kg (3.0 kg  $^{100}\text{Mo}$ )
- MMC sensor: Au:Er → Ag:Er
- Using same cryostat + two-stage temperature control:  $\langle \Delta T \rangle < 1 \mu\text{K}$
- Shielding enhancements:
  - Outer Pb: 15 → 20 cm; neutron shields
  - boric acid silicon + more PE / B-PE
  - More muon counter coverage
  - More supply of Rn-free air.

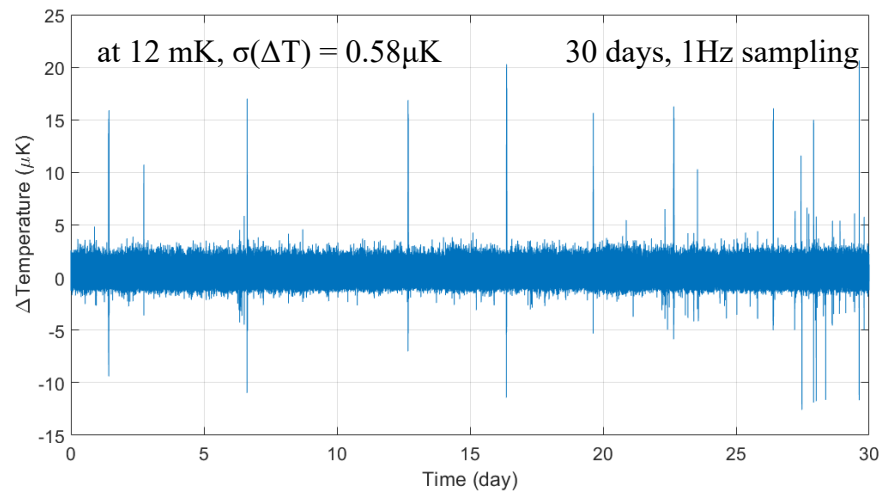

6 Pilot CMOs

7 New CMOs

5 New LMOs

# AMoRE-I (Preliminary) Results

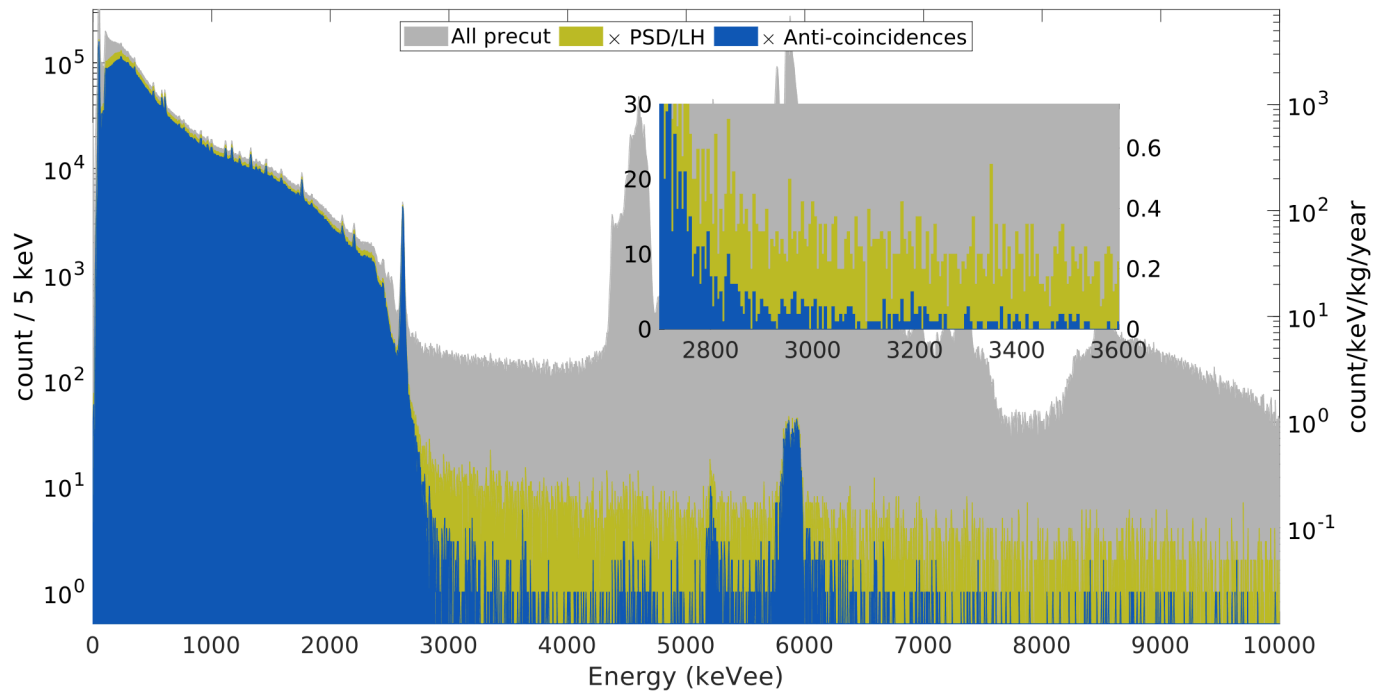

Dilution refrigerator temperature control

Recovery from power outage

12 mK physics data	Exposure (kg <sub>XMO</sub> ·yr)
Total	10.16
- Bad channels/runs	8.76
- deadtime & anti-coincidence (= live exposure)	8.02
in <sup>100</sup> Mo	3.88 (kg <sub>ISO</sub> ·yr)

# AMoRE-I backgrounds (Preliminary)

- All crystal excluding one LMO (for very poor  $\beta/\alpha$  discrimination power)
  - 13 CMO + 4 LMO: exposure =  $8.02 \text{ kgXM}_{\text{o}}\text{O}_4 \cdot \text{yr} = 3.88 \text{ kg}^{100}\text{Mo} \cdot \text{yr}$ .
- Anti-coincidence cuts reject events:
  - coincident at multiple crystals within 2 ms ( $\epsilon \sim 99.8\%$ ),
  - within 10 ms after a muon counter event ( $\epsilon \sim 99.8\%$ ),
  - within 20 minutes after a  $^{212}\text{Bi}$   $\alpha$ -decay event candidate ( $\epsilon \sim 98\%$ ).

Live exposure	Bkg. @ $Q_{\beta\beta}$ / ccky
Total (8.02 kgXM <sub>o</sub> O <sub>4</sub> yr)	$0.032 \pm 0.003$
CMO (6.19 kgXM <sub>o</sub> O <sub>4</sub> yr)	$0.031 \pm 0.003$
LMO (1.83 kgXM <sub>o</sub> O <sub>4</sub> yr)	$0.037 \pm 0.006$

# $^{100}\text{Mo}$ $0\nu\beta\beta$ limit from AMoRE-I

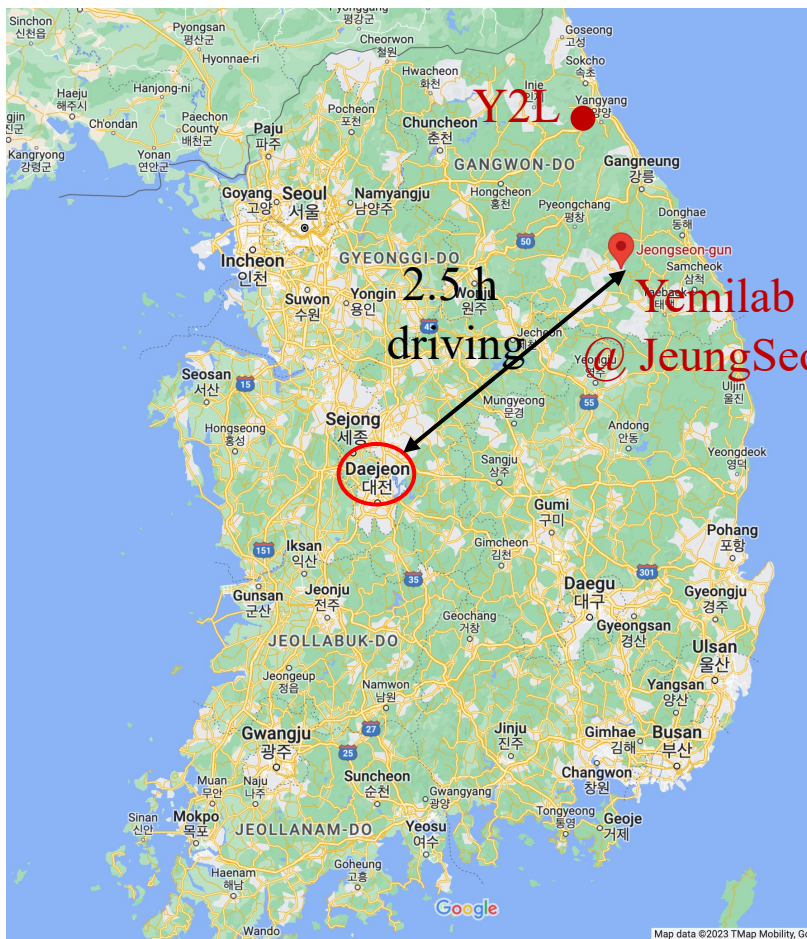

- $\text{ROI} = |E - Q_{\beta\beta}| < 2.5 \Delta E_{\text{FWHM}}$ ,  $\epsilon_{\text{containment}} \sim 81\%$ .
- Background =  $0.032 \pm 0.003$  counts/keV/kg/year, from ROI side-band.
- Unbinned likelihood for  $\Gamma^{0\nu}$  ( $= \ln 2 / T_{1/2}$ ) for each crystal, with signal shape and background rate constrained from calibration and sideband data, respectively.
- **$T_{1/2}^{0\nu} > 3.4 \times 10^{24}$  years at 90% C.L. for Mo-100**

# AMoRE-II in preparation at Yemilab

- In a new underground lab (Yemilab)
- With new cryostat and new shields

# AMoRE-II Cryogenics

- Three PTRs (PT420 RM)
- Dilution refrigerator
  - 6 mK base temperature w.o. wirings
  - 7 uW at 10 mK
- Spring Suspended Still with Eddy Current Damper
- Independent holding structure for detector tower

**1<sup>st</sup> Stage: 9 × 10 Modules**  
~ 24 kg crystal mass

**2<sup>nd</sup> Stage: +9 × 32 Modules**  
~ 160 kg crystal mass

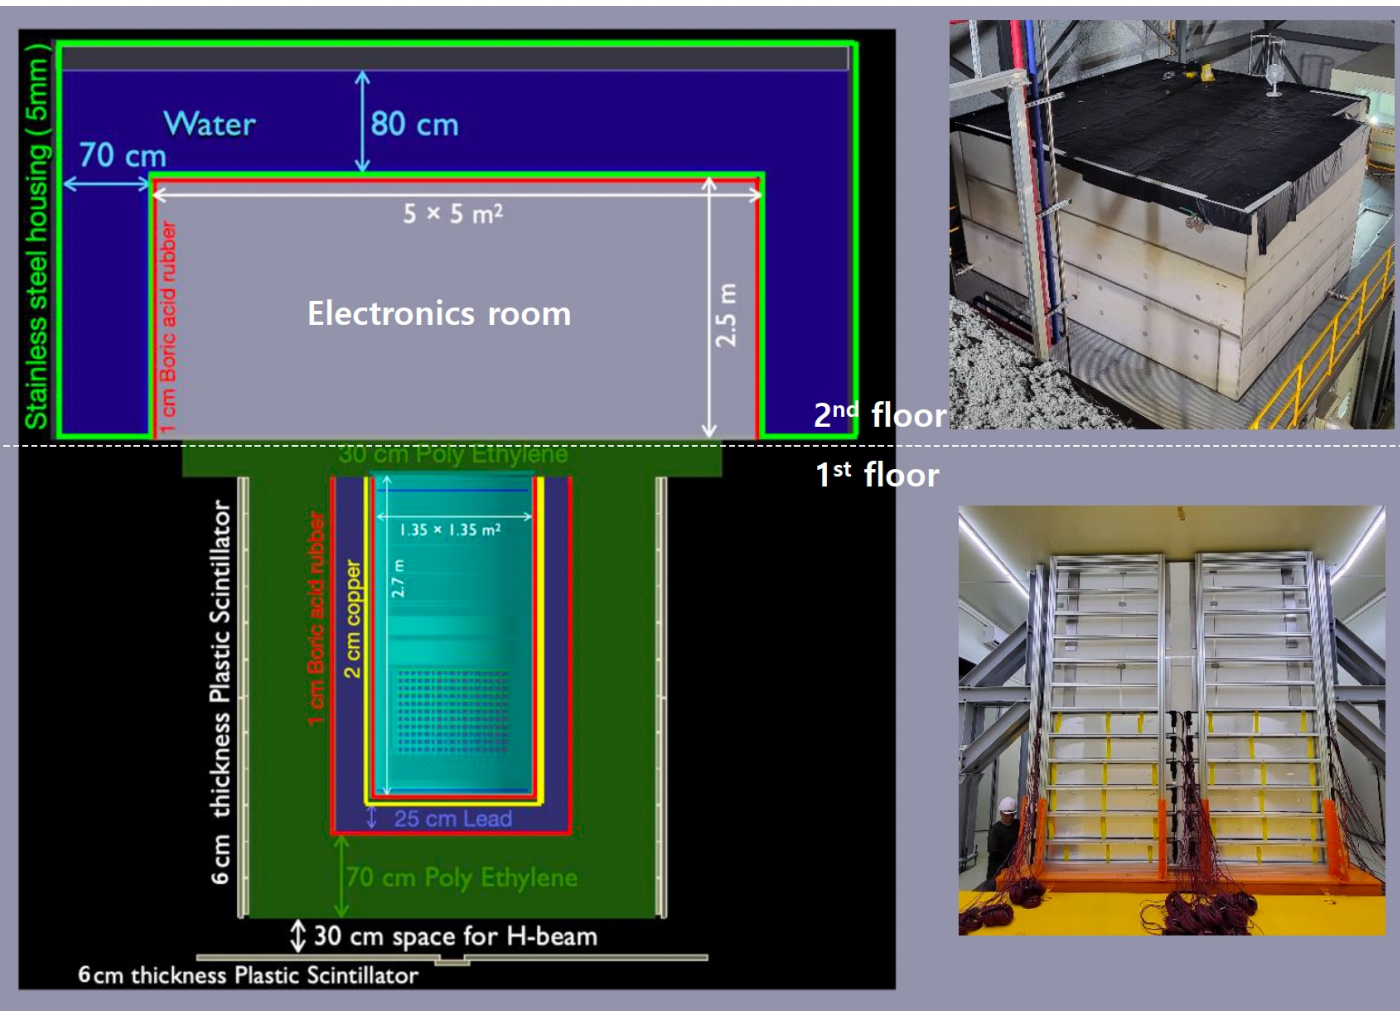

# Vibration damping systems

**Detector tower (Pb+Cu+LMO): ~ 3.4 ton**  
**Independent support of Kevlar strings + STS rods from room temp.**  
**Cooling method: IVC exchange gas + soft copper foils**

# AMoRE-II Shielding

- Pb 26 cm over the crystal towers, below the mixing chamber plate in IVC.
- Bottom: boric acid rubber 1 cm < Cu 2 cm < Pb 25 cm < boric acid rubber 1 cm < polyethylene 70 cm < Plastic scint.  $\mu$ -counter
- Top: boric acid rubber 1 cm < water Cherenkov  $\mu$ -counter 70-80 cm.
- Muon rate  $\sim 10^{-7} \text{ cm}^{-2} \text{ s}^{-1}$ .
- Radon-free air supply.

# Crystal preparation

- Mo-100 enrichment = 95%.
- Purification of MoO<sub>3</sub> and Li<sub>2</sub>CO<sub>3</sub> powder at CUP.
- Crystals produced at CUP/IBS and NIIC
- ~ 360 ea (~ 157 kg) of crystals (including AMoRE-I CMOs) will be ready by mid-2025.

MoO <sub>3</sub> powder Activity (μBq/kg)	Raw	Purified
Ac-228	260 ± 50	< 27
Th-228	210 ± 50	< 16
Ra-226	260 ± 50	110 ± 30
K-40	8500 ± 1400	1700 ± 340

Yeon H., et al. Front. Phys. 11, 1142136 (2023)

# AMoRE-II Background budgets

# Unresolved pileups of $^{100}\text{Mo}$ $2\nu\beta\beta$ signals

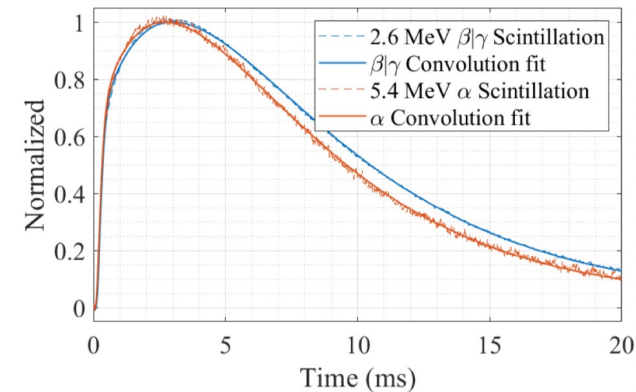

- 1 kg  $^{100}\text{Mo}$   $\rightarrow$   $\sim 20$  mBq of  $2\nu\beta\beta$        $T_{1/2}(2\nu\beta\beta \text{ } ^{100}\text{Mo})$ :  $\sim 7.1 \times 10^{18}$  year
- Timing resolution for pileup rejection:
  - :  $\sim 40 \mu\text{s}$  for  $10^{-5}$  cky in a  $\text{O}50 \times 50$  LMO (in most conservative way)
  - :  $\sim 100 \mu\text{s}$  goal for AMoRE-II

With heat-signal rise-time only.  
 $120 \mu\text{s}$  at 10 mK,  $60 \mu\text{s}$  at 40 mK

Astroparticle Phys. 91:105 (2017)

Light signals:  $\tau_{\text{rise, fast}} \sim 200 \mu\text{s}$   
 $\rightarrow \sim 100 \mu\text{s}$  rejection possibility

- Likelihood pileup rejections or machine learning should be implemented.

# AMoRE-II goals

(By KamLAND-Zen  
Phys. Rev. Lett. 130 (2023) 051801)

- AMoRE-II for  $T > \sim 5 \times 10^{26}$  years by 100 kg of  $^{100}\text{Mo}$   $\times$  5 years running.
- Reduction of background level down below  $10^{-4}$  ckky.

R&D challenges

(for future projects)

# SWOT for LT Detectors in $0\nu\beta\beta$ search

## Strengths

- ✓ High energy resolution
- ✓ Particle ID
- ✓ Proven technology

## Weaknesses

- ✓ Surface effect
- ✓ Unresolved pileups
- ✓ Bkg from copper
- ✓ Number of channels

## Opportunities

- ✓ Use of Cherenkov light
- ✓ New crystal targets
- ✓ Single-site selection
- ✓ Multiplexing
- ✓ Possible collaboration

## Threats

- ✓ Isotope production
- ✓ Crystal growing
- ✓ Purification

AMoRE-II  
is secure from these.

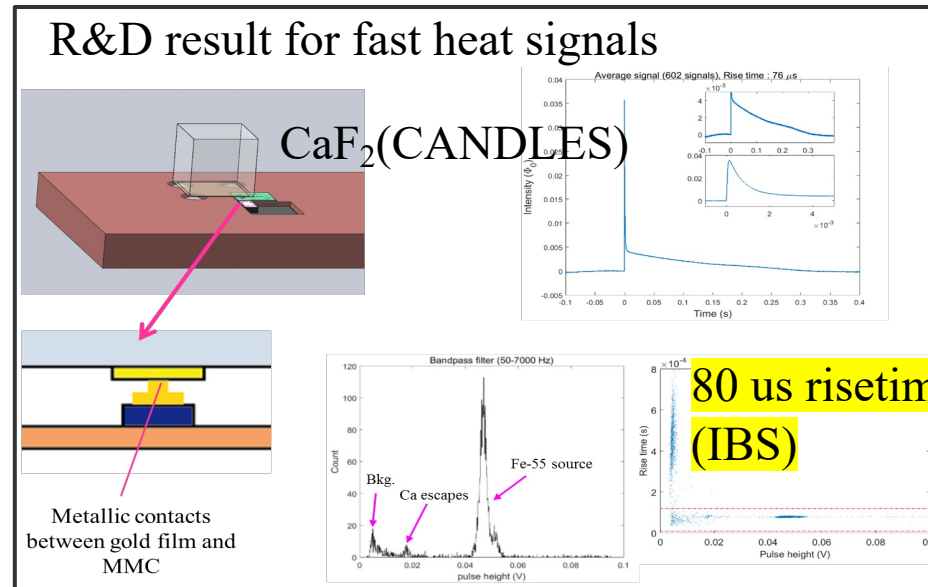

Any project after AMoRE-II  
is NOT.

# Technical tasks and challenges for future $^{100}\text{Mo}$ projects

---

- ✓ Unresolved pileups for Mo-100.
- ✓ Single-site event selection.
- ✓ Resolve position dependence for fast sensors.
- ✓ Multiplexing capability.

# R&D proposal to multi-site event rejection

- Fast heat & light signals.
- Finite phonon speed:  $\sim 10^5$  cm/s
- Correlated PSD can be studied.

Stay tuned for AMoRE
